Anthropic just rediscovered the monorepo problem Google solved a decade ago.

Their coding agents pushed git past its limits.

So they built their own version control from scratch.

@arxdsilva

Google and Meta already solved this with Piper and Sapling.

Where have you outgrown a tool built for human scale? Save this.

- Merges jumped from 2,500 to over 30,000 a day in four months
- Git assumes offline clients. Anthropic's are always-online agents
- Developers in the discussion warn: don't copy this unless you're Anthropic-scale
