@arxdsilva

Myth: your coding agent only sends what you typed.

Claude Code put users' emails in the User-Agent header of web requests.

The account email sat in the model's context all along.

@arxdsilva

My rule: anything in the agent's context is something it can send.

Fair warning or overblown? Pick a side, then save this.

- Subagents ran curl with an email, a name or even a repo in the header.
- The Claude Code team is removing the email from the model's context.
- Counterpoint: it mostly hit sites like the SEC, which require an email.
